AutoCAD Crack + Torrent (Activation Code) [Win/Mac] [March-2022]

What's the difference between AutoCAD Crack Mac and AutoCAD LT? AutoCAD (or AutoCAD LT) is the professional version of AutoCAD, and is the professional version of AutoCAD LT. AutoCAD LT (or AutoCAD LT Pro) is a more "basic" version of AutoCAD. AutoCAD 2016 Key Features: New feature: Illustrator files are no longer the only format for importing drawings into AutoCAD. New feature: Dimensional draftings are available for many 2D objects, including doors, walls, windows, and other physical objects. New feature: Live-link to vector graphics editors, such as Adobe Illustrator and Adobe Photoshop, is available in AutoCAD 2016. New feature: Geographic information is available with the new Dynamic Data Mapping tool. New feature: Objects such as doors, windows, and cabinets are available in the Intersect command. New feature: For complex 2D shapes, you can create a 2D spline, which can control the path of an object. New feature: You can send 2D images to a laser engraver. New feature: The interior and exterior border of an object can be automatically highlighted in the 3D model viewport. New feature: In the Align and Distribute tool, you can align objects. New feature: You can perform a region analysis. New feature: There is a conversion feature that automatically converts the drawing. New feature: You can add textual annotations to a drawing. New feature: There are several methods of measuring the size of a 2D drawing area, including a method based on the length of a line segment. New feature: The Bounding Box tool creates a 3D box that contains the boundaries of your object. New feature: The floating grid tool is available for more precise control over the drawing area. New feature: The Strip tool allows you to create a stripe that sticks to your drawing area. New feature: The Offset command is more robust for offsetting individual elements. New feature: You can apply an individual 3D drawing style to a 2D view. New feature: You can export many different file formats, including DXF. New feature: You can use a single installation to support multiple users. New feature: You can save objects

The present invention relates generally to carbon black-containing binders for electrocoating. Electrodeposition coating is widely used to apply protective and decorative finishes to metal parts or substrates, and includes processes such as anodizing, bright dipping, black dipping, electrogalvanizing and electrocoating. Electrodeposition is superior to other coating methods, such as, for example, spray-coating, in that the technology of electrodeposition can produce a high-quality finish on complex or highly-angled substrates and is more closely emulated by nature. One of the key components in electrodeposition coating compositions is a particulate or powder coating material. The powder coating material typically has a pigment, a resin, and, optionally, solvents, water, surfactants, coalescing agents, crosslinking agents, flow control agents and rheology modifiers. The powder coating material can be based on a two-part binder system, which includes a functional resin, and a crosslinking agent. The functional resin typically includes, for example, acrylic, polyester, polyether, epoxy, vinyl and polyurethane resins, while the crosslinking agent is typically, for example, a polyisocyanate or a melamine resin. The functional resin and the crosslinking agent are combined before the coating operation to form a two-part coating composition. In order to protect the substrate from corrosion, a non-conductive film is formed on the surface of the substrate. To do so, the electrodeposited coating composition is frequently cured at an elevated temperature to form a non-conductive film. A cured film, after curing, acts as a protective barrier between the substrate and the environment. Some electrodeposited coating compositions comprise conductive pigments, such as, for example, carbon black. Such pigments allow the electrodeposited coating composition to be electrically conductive, thereby allowing electrodeposited coating compositions to be cured to form a conductive film. However, in some cases, the conductive film formed on the substrate by electrodepositing a conductive coating composition, which comprises a conductive pigment, has relatively high haze and poor appearance. Additionally, there is a desire to improve the appearance of the electrodeposited coating film, for example, by lowering the haze of the film. It is thus desirable to develop an electrodeposited coating composition that can produce a conductive coating having
